Declaration of AI-Generated Material

Student: Mukhamyedali Askhar
Subject: CP3406 / CP5307
Assessment: Assignment 1 - Utility App
Project: Pocket Exchange
Prepared: 25 October 2026

Generative AI tool: OpenAI ChatGPT.

AI assistance was used to review the supplied assignment brief and starter project and generate the currency converter implementation, Retrofit service, repository and dependency injection setup, ViewModel, Compose screens, input validation, unit tests, README, submission guidance and reflection draft.

Inputs included the assessment PDF, the supplied MobileTech_UtilityApp starter ZIP and lecturer examples of ViewModel, StateFlow, lifecycle dependencies and Retrofit networking.

The reflection is a draft that requires personal review. It must not be used to claim feelings, testing or development experiences that did not occur. The project build was attempted, but dependency download was blocked by network availability; compilation, execution and live API behavior have not been confirmed.

The student should review and understand the generated work, run and document verification, acknowledge the starter and other sources, and confirm that the assistance is allowed under the subject's assessment instructions. Retain the relevant AI conversation if required.

No GitHub account was accessed, repository published or historical commits created. Add the real repository link separately after uploading and sharing the work.
